Push Apollo.ai to Your GitHub Account

I've prepared your Apollo.ai repository for GitHub! Here's how to push it to your account **seanshannon**.

✅ What's Ready

- ✅ All code committed with proper git history
- ✅ Heat map fixed with OpenStreetMap tiles
- ✅ Intelligent Next Steps generation for support queries
- ✅ Your GitHub account (seanshannon) is connected

🚀 Quick Push (3 Steps)

Step 1: Create Repository on GitHub

1. Go to: **https://github.com/new**
2. **Repository name**: `apollo-ai`
3. **Description**: `Apollo.ai - Natural Language Database Intelligence Platform with Enterprise Security`
4. **Visibility**: Choose **Public** (recommended for portfolio) or Private
5. **IMPORTANT**: **DO NOT** check any boxes (no README, no .gitignore, no license)
6. Click **"Create repository"**

Step 2: Copy Your Repository URL

After creating, GitHub will show you a page with setup commands. **Copy your repository URL** - it will look like:

```
https://github.com/seanshannon/apollo-ai.git
```

Step 3: Push to GitHub

Open your terminal on your local machine and run these commands:

```
# Navigate to the project (if you have it locally)
cd /path/to/apollo-ai

# If you're working on the cloud instance, use these commands:
cd /home/ubuntu/data_retriever_app

# Add GitHub as remote
git remote add origin https://github.com/seanshannon/apollo-ai.git

# Rename branch to main (if needed)
git branch -M main

# Push to GitHub
git push -u origin main
```

🔐 Authentication

When prompted for credentials:
- **Username**: seanshannon
- **Password**: Use a **Personal Access Token** (not your GitHub password)
- Generate one at: https://github.com/settings/tokens
- Select scopes: `repo` (full control of private repositories)
- Copy the token and paste it as the password

📦 What's Included

Your repository includes:
- ✨ Full Next.js application with TypeScript
- 🔐 Enterprise security (encryption, PII masking, audit logging)
- 🗄️ Multi-database support (PostgreSQL, Oracle, MariaDB)
- 📊 Data visualizations (tables, charts, heat maps)
- 🧪 Comprehensive test coverage
- 📚 Detailed documentation
- 🎨 Modern UI with dark theme and animations

📝 Repository Structure

```
apollo-ai/
├── nextjs_space/         # Next.js application
│   ├── app/              # App router pages and API routes
│   ├── components/       # React components
│   ├── lib/              # Core libraries (auth, db, encryption)
│   ├── prisma/           # Database schema
│   └── __tests__/        # Test suites
├── documentation/        # User guides and API docs
└── README.md             # Project overview
```

🎯 After Pushing

Once pushed, your repository will be live at:
https://github.com/seanshannon/apollo-ai

You can then:
- ⭐ Add a GitHub star
- 📋 Create issues for feature requests
- 🌿 Create branches for new features
- 👥 Invite collaborators
- 🚀 Set up CI/CD workflows

🆘 Troubleshooting

"Authentication failed"
- Make sure you're using a Personal Access Token, not your password
- Token must have `repo` scope

"Remote origin already exists"

- Run: `git remote remove origin`
- Then retry Step 3

"Failed to push"

- Make sure the repository is empty (no README or files)
- If GitHub added files, use: `git push -f origin main`

📞 Need Help?

If you encounter any issues, let me know and I'll help you troubleshoot!
